

ALGEBRA

EXPRESSIONS AND EQUATIONS

ORDER OF OPERATIONS

(PE)(MD)(AS)

- (PE)
Do parentheses and exponents FIRST
- (MD)
Solve all multiplying and dividing from left to right. (It may be divide first)
- (AS)
Solve all adding and subtracting from left to right. (It may be subtract first).

EXAMPLES:

EXPRESSION	EVALUATION	OPERATION
$50 - 12 \div 3 \cdot 6 =$	$50 - 12 \div 3 \cdot 6 =$	Division
	$50 - 4 \cdot 6 =$	Multiplication
	$50 - 24 =$	Subtraction
	26	
$22 - (8 + 6) + 20 =$	$22 - (8 + 6) + 20 =$	Parentheses (Add)
	$22 - 14 + 20 =$	Subtraction
	$8 + 20 =$	Addition
	28	

EXPONENTS

Exponents tell how many times to multiply a number by itself.

$$3^2 = 3 \cdot 3 = 9$$

$$4^3 = 4 \cdot 4 \cdot 4 = 64$$

$$3^3 = 3 \cdot 3 \cdot 3 = 27$$

$$5 \times 5 = 25$$

OPERATION KEYWORDS

Addition	increased by more than combined, together total of sum added to
Subtraction	decreased by minus, less difference between/of less than, fewer than
Multiplication	of times, multiplied by product of increased/decreased by a factor of (this type can involve both addition or subtraction and multiplication!)
Division	per, a out of ratio of, quotient of percent (divide by 100)
Equals	is, are, was, were, will be gives, yields sold for

WRITING EXPRESSIONS

PHRASE	EXPRESSION
8 more than a number	$8 + n$
7 less than a number	$n - 7$
The product of a number and 11	$11n$
The quotient of 6 and a number	$\frac{6}{n}$
A number decreased by 12	$n - 12$

$$(x+1)(y-2)$$

EVALUATING EXPRESSIONS

You evaluate an expression by replacing the variable with the given number and performing the indicated

**Evaluate
means
PLUG IT IN!**

Examples

Replace a with 15 and then multiply:

$$10a = \quad \text{*Replace } a \text{ with } 15$$

$$10(15) = \quad \text{*}(\) \text{ is another way to write mult.}$$

$$150 \quad \text{*Multiply together}$$

Replace x with 3.2 and then add:

$$4.5 + x =$$

$$4.5 + 3.2 =$$

$$7.7$$

INPUT OUTPUT TABLE

Input	Output
6	4
9	7
12	?
15	?
n	$n - 2$

A function table is a table of ordered pairs that follow a rule. A rule tells how one number is related to another.

Rule: Subtract 2
 $n - 2$

WRITING EQUATIONS

Problem: Jeanne has \$17 in her piggy bank. How much money does she need to buy a game that costs \$68?

Solution: Let x represent the amount of money Jeanne needs.

Then the following equation can represent this problem:
 $17 + x = 68$

SOLVING EQUATIONS

To solve a one-step equation, do the inverse of whatever operation is being done to the variable. Because it is an equation, what is done to one side of the equation must be done to the other side of the equation.

One-Step Equations

Solve an addition equation by subtraction.

$$x + 3 = 7$$

$$\quad -3 \quad -3$$

$$x = 4$$

Solve a subtraction equation by addition.

$$x - 8 = 5$$

$$\quad +8 \quad +8$$

$$x = 13$$

Solve a multiplication equation by division.

$$\underline{5}x = \underline{35}$$

$$\underline{5} \quad \underline{5}$$

$$x = 7$$

Solve a division equation by multiplication.

$$\frac{x}{7} = 3$$

$$(7)\frac{x}{7} = 3(7)$$

$$x = 21$$

TWO-STEP EQUATIONS

Two-step equations are exactly like what they sound like: equations that take TWO STEPS to solve.

You have to use INVERSE OPERATIONS to solve each equation.

add \longleftrightarrow subtract
multiply \longleftrightarrow divide

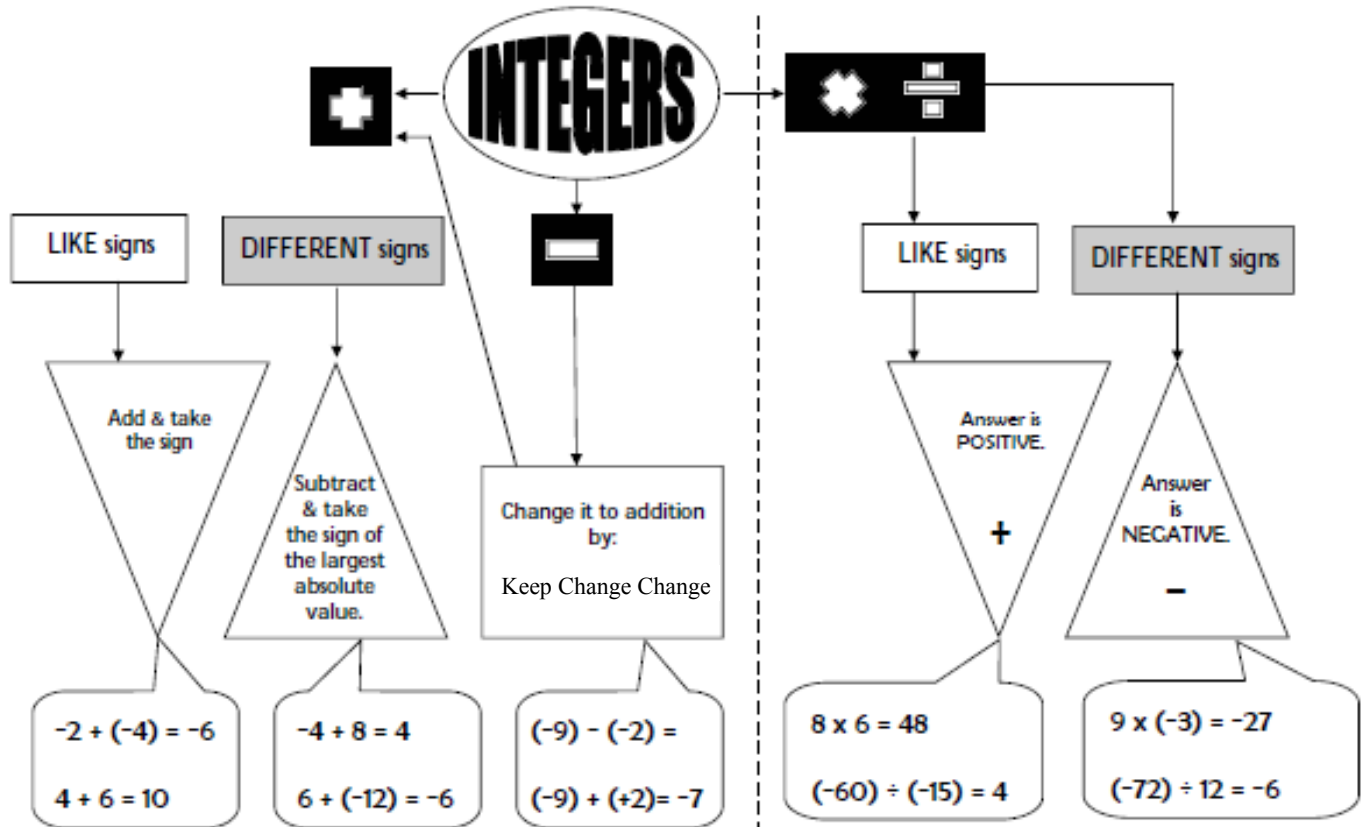

The goal is to get the variable by itself on one side of the equal sign. You need to do the inverse operation of what is furthest from the variable without crossing an equal sign.

Below are examples of 2-step equations and how to solve using algebraic notation:

$\begin{array}{r} 2x + 5 = 9 \\ -5 \quad -5 \\ \hline 2x = 4 \\ \div 2 \quad \div 2 \\ \hline x = 4 \end{array}$ <p>Subtract 5 to undo addition</p> <p>Divide by 2 to undo multiplication</p>	$\begin{array}{r} 18 = \frac{x}{2} - 8 \\ +8 \quad +8 \\ \hline 26 = \frac{x}{2} \\ \cdot 2 \quad \cdot 2 \\ \hline 52 = x \end{array}$ <p>Add 8 to undo subtraction</p> <p>Multiply by 2 to undo division</p>
$\begin{array}{r} 3(x - 2) = 18 \\ \div 3 \quad \div 3 \\ \hline x - 2 = 6 \\ +2 \quad +2 \\ \hline x = 8 \end{array}$ <p>Divide by 3 to undo multiplication</p> <p>Add 2 to undo subtraction</p>	$\begin{array}{r} \frac{x + 8}{4} = 9 \\ \cdot 4 \quad \cdot 4 \\ \hline x + 8 = 36 \\ -8 \quad -8 \\ \hline x = 28 \end{array}$ <p>Multiply by 4 to undo division</p> <p>Subtract 8 to undo addition</p>
$\begin{array}{r} -8 + 3x = -26 \\ +8 \quad +8 \\ \hline 3x = -18 \\ \div 3 \quad \div 3 \\ \hline x = -6 \end{array}$ <p>Add 8 to undo adding (-8)</p> <p>Divide by 3 to undo multiplication</p>	$\begin{array}{r} -18 = -2x - (-9) \\ -9 \quad -9 \\ \hline -27 = -2x \\ \div -2 \quad \div -2 \\ \hline 13.5 = x \end{array}$ <p>Subtract 9 to undo $-(-9)$ or $+9$</p> <p>Divide by -2 to undo multiplying by -2</p>

INTEGER RULES ²¹

RULES FOR OPERATIONS

FOUND AT <http://www.sw-georgia.resa.k12.ga.us/integer%20rules.pdf>

ADDING INTEGERS

Same Sign: Add and keep the sign

$$2 + 2 = 4$$

Positive + Positive = Positive

$$(-2) + (-2) = (-4)$$

Negative + Negative = Negative

Different Signs: Subtract and keep the sign of the larger value (from zero)

$$(-9) + 2 = (-7)$$

Big Negative + Small Positive = Negative

$$(-2) + 9 = 7$$

Small Negative + Big Positive = Positive

MULTIPLYING AND DIVIDING INTEGERS

Positive x Positive = Positive

Negative x Negative = Positive

Negative x Positive = Negative

Positive x Negative = Negative

Division (same pattern)

SUBTRACTING INTEGERS

Subtracting a negative is like ADDING A POSITIVE!

$$\begin{array}{r} 2 - (-2) = \\ 2 + 2 = 4 \end{array}$$

**KEEP
CHANGE
CHANGE**

Subtracting a positive IS subtracting or like ADDING A NEGATIVE!

$$\begin{array}{r} -8 - 4 = \\ -8 + (-4) = -12 \end{array}$$

Subtracting Integers

Subtraction is the same as **adding the opposite**, so rewrite subtraction problems as addition problems and then use addition rules.

$$\begin{array}{l} -6 - 3 = -6 + -3 = -9 \\ 4 - -9 = 4 + 9 = 13 \\ 2 - 7 = 2 + -7 = -5 \end{array}$$
